Sprint period

The sprint period spanned weeks number 12, 13 and 14. More specifically starting the 22th of March and lasting until April 04th. This period spans the easter holiday and therefore we have added less goals as we will spend less time working during this period.

Goals

- Add all repositories and work on controllers and services.
- Finish search results components

Work distribution

Daniel will be working on the controller and services. The goal is to get most of the main API done, and later add error handling and documentation.

Anders will continue work on search results components in frontend.

Accomplishments

More work was done to the search results components. We also did some research about a bug with the theme flashing when changing locales. Did various improvements to the theming implementation.

Added more services for each entity and controllers, been doing test to see if everything works and add some swagger documentation.
