Sprint period

The sprint period spanned weeks number 19, 20 and 21. More specifically starting the 7th of April and lasting until May 23rd.

Goals

Goal is to get the project to a finished state before the deadline.

- Finish the API
- Write all doc for backend
- Finish Postman test
- Finish mandatory component in frontend
- Connect all frontend logic to the backend
- Cleanup and make final touches on frontend
- Write documentation, record video and upload everything

Work distribution

Daniel will work on getting the backend finished and get some work done on the controlpanel. Anders will check if the backend is good, work with the frontend and get that done.

Accomplishments

Finish up backend with all methods, user authentication, java and swagger doc and testing it with a postman run test. All was pushed to main, and Argo was updated to run the latest version in production.

Daniel tried to add some features to the frontend controlpanel, but only got a few to work befoure the deadline.

In the frontend we added product page, saved page, fix small issues and made some improvements.

We did some more work to try and finalize the frontend and make sure everything worked flawlessly. Sadly we got a bug where we could not parse the JWT token from the API and therefore did not accomplish connecting authenticated API-endpoints to the frontend.
